

# Live/Dry Blood Analysis

Live blood analysis is an incredibly useful tool for assessing your nutritional and cellular health. It provides you with more detail than the standard blood draw that we send off to a lab (and that you may be used to from a medical doctor's office).

We take only a sample, virtually without pain, from your finger. Then, with the aid of advanced microscopic and video equipment, we can give you immediate insights about multiple vitamin and mineral deficiencies, toxicity, tendencies toward allergic reaction, excess fat circulation, liver weakness, and arteriosclerosis. All of these play a vital role when it comes to cancer prevention and growth.

This assessment gives us insight as to which areas of your body aren't functioning at their full capability and allows us to pin point which deficiencies we need to address in order to bring you back to optimal health in order to best support you throughout your cancer journey.
